underground energy is important for the whole society development but conventional underground energy is becoming exhausted the energy for deep reservoirs usually 3500m for petroleum engineering 1000m for mining engineering is diverse including not limited shale gas oil tight gas oil hot dry rock geothermal reservoirs and coal gasification although it has abundant reserves the energy production from deep reservoirs is difficult in stimulations because the geological conditions for those deep reservoirs are tougher than those for conventional reservoirs such as high in situ stress obvious heterogeneity in rock properties and complex natural fracture networks meanwhile common technologies also have environmental impacts the development trend of production technology for deep reservoirs requires it to be environment friendly or decrease environmental impacts at least co2 utilization may achieve this environmental aim in order to efficiently produce energy from deep reservoirs technological innovation is booming around north america europe and asia

this book is a comprehensive resource that explores the latest advancements in upstream petroleum engineering covering fundamental principles and cutting edge innovations it provides a thorough understanding of hydrocarbon exploration drilling reservoir characterization production and enhanced oil recovery eor it delves into advanced techniques such as chemical microbial miscible and thermal eor along with reservoir modeling simulation

and digital optimization using artificial intelligence ai and machine learning the book also emphasizes health safety and environmental management addressing key performance indicators risk assessment carbon footprint reduction and regulatory compliance a dedicated section on environmental modeling discusses oil spill mitigation emissions control and sustainable energy solutions designed for students researchers and industry professionals this book bridges theoretical knowledge with industry applications making it an essential reference for those navigating the evolving challenges of petroleum exploration and production by integrating modern technological developments with traditional engineering practices the book equips readers with the knowledge needed to enhance efficiency maximize recovery and ensure sustainable energy production

this book brings a thorough explanation on the path needed to use cloud computing technologies to run high performance computing hpc applications besides presenting the motivation behind moving hpc applications to the cloud it covers both essential and advanced issues on this topic such as deploying hpc applications and infrastructures designing cloud friendly hpc applications and optimizing a provisioned cloud infrastructure to run this family of applications additionally this book also describes the best practices to maintain and keep running hpc applications in the cloud by employing fault tolerance techniques and avoiding resource wastage to give practical meaning to topics covered in this book it brings some case studies where hpc applications used in relevant scientific areas like bioinformatics and oil and gas industry were moved to the cloud moreover it also discusses how to train deep learning models in the cloud elucidating the key components and aspects necessary to train these models via different types of services offered by cloud providers despite the vast bibliography about cloud computing and hpc to the best of our knowledge no existing manuscript has comprehensively covered these topics and discussed the steps methods and strategies to execute hpc applications in clouds therefore we believe this title is useful for it professionals and students and researchers interested in cutting edge technologies concepts and insights focusing on the use of cloud technologies to run hpc applications

the first north sea oil and gas reservoirs conference was held in trondheim in 1985 as part of the norwegian institute of technology s 75th anniversary celebrations favourable reactions from the delegates prompted the committee to re run the event some three and a half years later and it is now intended that the conference be held on a regular basis as long as there is a demand for this type of gathering the objectives of the 1989 conference which were broadly similar to those of the previous one were a to bring together those engaged in various geoscientific and reservoir engineering aspects of north sea oil and gas reservoirs in one forum b to demonstrate wherever possible the interdependence of the various disciplines and specializations c to promote innovative synergistic approaches to research and development programmes aimed at north sea conditions and d to reflect current trends in the reservoir sciences naturally there was no place for specialist parallel sessions in a conference aimed at encouraging interdisciplinary integration and awareness

the proceedings of this important conference are aimed at those engaged in remote control and monitoring of underwater systems all aspects of underwater engineering are covered including underwater repair and replacement adoption of oceanographic defence and marine technology to meet the needs of the offshore oil and gas industry will be of particular interest subsea control and data acquisition will be essential reading for those in the offshore oil and gas industry who have involvement in or responsibility for subsea production control and monitoring systems as well as those in industry who are dealing with related technologies
